

This guide explains, in plain language, how your new website works, where your content lives, and how to add, change or remove things yourself. No technical background is needed for parts 1 to 6. Part 7 is for whoever looks after the hosting.

1. How the website works
2. The one rule to remember
3. Where each thing is managed
4. Step by step: adding, editing, removing
5. Tags: how you control where things appear
6. If something is not showing
7. Hosting, deployment and security
8. Before launch

1. How the website works

Your website has two halves that work together.

The website itself	The pages visitors see at therobonest.com. It is hosted on a service called Netlify, which keeps it fast and always online.
Odoo	The business system you already use for CRM and events. This is also where the website's content is kept: blog posts, events, videos, team members, partner school logos, the About page text and your social links.

The website reads from Odoo automatically. When you publish something in Odoo, the website notices within **5 minutes** and updates itself. Nobody needs to touch the website, and no developer is involved.

It also works the other way. When a visitor fills in the enquiry form or registers for an event, that information is written straight into Odoo: enquiries become **Leads in CRM**, and event sign-ups appear under the event's **Attendees**.

Why 5 minutes? The website keeps a ready-made copy of every page so it loads instantly for visitors. Every 5 minutes it checks Odoo for changes and refreshes that copy. This is what makes the site fast and cheap to run. If you publish something and do not see it yet, wait 5 minutes and reload the page twice.

Some things are built into the website rather than kept in Odoo, because they rarely change: the home page headline and videos, the three lab descriptions, the statistics, the hardware showcase, the Institution Gallery photos, the contact details, and Nesty the robot's answers. Changing any of these is a small job for the developer (see part 7).

2. The one rule to remember

Saving is not publishing. Every item in Odoo has a **Published** switch. Until it is on, the website cannot see the item, even though it is saved. When something is missing from the site, check this switch first. It is the cause nine times out of ten.

Where to find the switch: on blog posts and events it is a toggle at the top of the form, or a switch on the page after you click **Go to Website**. On videos it is on the content item. On contacts (school logos) it is on the website tab of the contact.

3. Where each thing is managed

What	Where in Odoo	Where it appears on the site
Blog posts	Website → Blog Posts	Blog page and each post's own page. Nesty also recommends one at random.
Events	Events	Events page (Upcoming and past), each event's own page
Event photos and videos	The event → Go to Website → Edit	"How it went" photo gallery and video players on the event page
Event popup	Events → tag <code>Popup</code>	Small corner card on every page. Nesty announces it too.
Event registrations	Events → the event → Attendees	Sign-ups from the website land here
Videos	eLearning	Videos page and the home page playlist
Team members	Employees	Team section on the home and About pages
Partner school logos	Contacts (tag <code>School</code>)	"Trusted by Leading Schools" line and the schools strip
About page long text	Knowledge → article "Website: About"	Body of the About page
Social links	Website → Edit → footer icons block	Footer icons
Enquiries	CRM → Leads (arrive by themselves)	From "Book a Demo Lab Setup" and the bottom form

4. Step by step: adding, editing, removing

4.1 Blog posts

Write a post

[Website](#) → [Blog Posts](#) → [New](#)

1. **Title** becomes the page heading and the browser tab.
2. **Subtitle** is the line under the title.
3. **Body**: write in the editor. Drag photos straight in. To add a YouTube video, paste its link on a line of its own.
4. **Tags**: choose from the list (see part 5). Tag `Homepage` to feature it.
5. **SEO panel** (globe icon): fill in Meta Title and Meta Description. This is what Google shows.
6. Switch **Published** on.

Appears on the Blog page as a card and gets its own page. Formatting is restyled to match the site, so it always looks consistent.

To edit: open the post, change it, save. **To remove:** switch Published off. The post stays in Odoo but disappears from the site. Only delete it if you want it gone from Odoo as well.

4.2 Events

Create an event

Events → New

1. **Event Name**
2. **Date:** start and end. **The end date decides** whether the event shows under Upcoming or moves to the past timeline. Nothing else to set.
3. **Venue / Address**
4. **Cover image:** the card picture and page banner.
5. **Tags:** `Popup` , `Homepage` , `Info Only` as needed (part 5).
6. Switch **Published** on.

Appears under Upcoming events, gets its own page, and moves itself to the past section once the end date passes.

Add the description, photos and videos

Events → the event → Go to Website → Edit

The description is **not** on the event form. Odoo only shows it through the website editor. Click the **Go to Website** button at the top of the event, then **Edit**. The page body is the description.

1. Write the recap or details in the page body.
2. Drag in as many photos as you like.
3. Paste YouTube links on their own lines.
4. Click **Save**.

The photos become a "How it went" gallery with a full-screen viewer, and the videos become players. Do not use the "Notes & Documents" tab: that is internal and never appears on the site.

You want	Do this	The site shows
People to register online	Just set future dates	"Registration open" and a sign-up form
Announce only, no sign-up	Add the tag <code>Info Only</code>	"Announcement", no form, a contact link instead
Show a finished event	Nothing, the date passing is enough	"Completed" and the photo gallery

The popup: tag one upcoming event `Popup` . It becomes the corner card on every page and Nesty mentions it. Remove the tag to stop promoting it. If no event is tagged, the next upcoming event is used automatically.

Registrations: open the event and click **Attendees**. The website only shows the form while the event is published and registrations are open in Odoo.

4.3 Videos

Add a video

eLearning → a course → Add Content → Video

1. Open or create a **course**. The course name becomes the filter button on the Videos page, so name it well: "Lab Setup", "Student Projects", "Astronomy", "Events".
2. Choose **Add Content** → **Video** and paste the **YouTube link**. Odoo fills in the title, thumbnail and length by itself.
3. Tags: **Homepage** to feature it on the home page, **Short** for a vertical video.
4. Switch **Published** on.

Appears on the Videos page under its course's filter button. Drag videos up and down inside the course to change their order on the site. Only YouTube links are used, nothing is uploaded.

Replace the sample videos. The videos currently in eLearning point at placeholder links. Open each one and swap in a real RoboNest video before launch.

4.4 Team members

Add a team member

Employees → New

1. **Name** and **Job Position** (the role shown under the name).
2. **Photo**: the square at the top right of the form.
3. **Tags**: **Leadership** for a large card with a quote, **Executive Team** for a circular portrait, and **Homepage** to also show on the home page.
4. **HR Settings tab** → **Additional Note**: the quote under a leadership card.

Home page: only people tagged Homepage, up to 8. About page: everyone. If there is no photo, the site shows a coloured circle with the person's initials rather than a grey silhouette. People appear in the order they were created.

To remove: archive the employee. Note that adding an employee also creates a Contact automatically. That is normal.

4.5 Partner school logos

Add a school or college

[Contacts](#) → [New](#)

1. Tick **Company** (not Individual).
2. **Name**, and upload the crest as the **Image** (square, on white or transparent, works best).
3. **Tags**: [School](#).
4. Switch **Published** on.

Appears in the "Trusted by Leading Schools" line and the scrolling strip. To remove a school from the site, take the School tag off. That keeps the customer record and its history.

4.6 About page text

[Knowledge](#) → [article "Website: About"](#)

Open the article, edit the text (headings, lists, quotes and images all work), keep it Published. **Do not rename it**: the site finds it by that exact title.

4.7 Social links

[Website](#) → [Go to Website](#) → [Edit](#) → [click the footer icons block](#)

Paste each address in the right-hand panel and Save. An empty field shows no icon, which is deliberate. Currently set: Instagram (robonest2026) and YouTube (@Robonest2026). Facebook is blank until the page address is confirmed.

4.8 Enquiries

Nothing to set up. Every website enquiry creates a **Lead** in **CRM** → **Leads** within seconds, titled "Lab enquiry - (school name)", with the contact's name, phone, designation, state and any message in the notes. Work them like any other lead. If one seems missing, check you are in Leads (not Opportunities) and clear the filters.

5. Tags: how you control where things appear

Tags are the steering wheel. Where an item shows up is decided by the tag you pick in Odoo, not by the developer. This is the complete list.

Tag	Used on	What it does
Placement		
Homepage	Events, posts, videos, employees	Features the item on the home page
Popup	Events	Becomes the corner popup and Nesty's announcement. Soonest upcoming one wins.
Info Only	Events	Announce it with no sign-up form
Short	Videos	Vertical phone-style frame instead of widescreen

School	Contacts	Puts the logo in the schools strips
Leadership	Employees	Large photo card with a quote
Executive Team	Employees	Circular portrait
Topics and filters		
Astronomy , AI & Robotics	Events, posts, videos	Topic grouping and filter buttons
Workshop , Exhibition	Events	Topic grouping
Announcement	Posts	Filter button on the blog
Lab Setup , Student Projects , Events	Videos	Filter buttons on the Videos page

No tag is fine. An untagged item still appears on its own listing page. Tags only add extra placement.

6. If something is not showing

Symptom	Almost always
New post or event missing	Published is off
Published, still missing	Wait 5 minutes, then reload twice
Event in the wrong section	Its end date
Registration form not showing	Tagged Info Only, the date has passed, or registrations are closed in Odoo
Popup not showing	There is no upcoming event, or that visitor already closed it
Event photos not in the gallery	They were added under Notes & Documents instead of Go to Website → Edit
Video has no thumbnail	The link is not a standard YouTube link
Vertical video has black bars	Missing the Short tag
Team member not on the home page	Missing the Homepage tag
School logo missing	No School tag, not Published, or no image
Social icon missing	That field is empty. Deliberate.
Enquiry not in CRM	Look under Leads, not Opportunities. Clear the filters.
Everything from Odoo is empty at once	The connection between the site and Odoo needs attention. Contact the developer.

7. Hosting, deployment and security

For whoever owns the technical side. The full developer reference is the file `docs/WEBSITE-GUIDE.md` in the code repository.

Where the site runs

Hosting	Netlify. Production address <code>statuesque-gumption-d78cb1.netlify.app</code> until the custom domain is pointed at it.
Code	GitHub repository <code>sanheensethi/therobonest</code> , branch <code>main</code> .
Deployment	Automatic. Every change pushed to <code>main</code> is built and published by Netlify in 3 to 5 minutes. Nothing to press.
Rolling back	Netlify keeps every version. In Netlify: Deploys, pick an earlier one, Publish deploy. Instant.
Odoo connection	Four settings in Netlify (Site configuration, Environment variables): the Odoo address, database name, the login email, and an API key.

Security of the Odoo connection

The website talks to Odoo using an API key. That key carries the full permissions of the Odoo user it belongs to, so it is kept only on the server side at Netlify. It is never included in the pages sent to visitors' browsers. The only things the website can write into Odoo are CRM leads and event registrations. Employee photos are served through a locked-down passage that only allows the specific photo fields the site needs.

Rotate the API key before launch. The key used during setup was shared over chat. In Odoo: the API user's Preferences, Account Security, create a new key. Put it into Netlify, redeploy, then delete the old key. No downtime if done in that order.

Changing things that live in code

These are edited in one file and go live on the next automatic deploy, usually a few minutes of a developer's time:

- Home page headline, subheading and the four proof points
- The three hero videos and the hardware clips
- The three lab cards and their bullet points
- Statistics (10,000+ students, 10 days, 3 labs, 100% educator-led)
- Institution Gallery photos
- Contact details (address, phones, email)
- Nesty's answers and the speech bubbles per section

Moving the domain: what changes for you

Today **therobonest.com** shows the old Odoo website, and the Odoo login is at `www.therobonest.com/web/login` . At launch the domain is pointed at the new website, and Odoo moves to its own address:

New website	<code>https://www.therobonest.com</code> (and <code>therobonest.com</code> redirects to it)
Odoo login, from launch	<code>https://odoo.therobonest.com/web/login</code>
Old bookmarks	Keep working. <code>therobonest.com/odoo</code> , <code>/web/login</code> and portal links all forward to the new Odoo address automatically.
Email	Unaffected. Mail settings for the domain are not touched.

Downtime	None. Odoo is reachable on its new address before the main domain is switched, and the old address forwards afterwards.
----------	---

The technical sequence (DNS records, Netlify domain setup, the Odoo address setting) is written step by step in part 9 of the developer guide. The one thing the RoboNest side needs to provide is **access to the domain's DNS settings** (wherever therobonest.com was registered), or someone who can add the records when asked.

Search engines: the site publishes `sitemap.xml` (every page, post and event, refreshed every 5 minutes), `robots.txt`, and `llms.txt`, a plain summary of the company for AI assistants such as ChatGPT and Gemini. All three are generated automatically. After launch, submit the sitemap in Google Search Console once.

8. Before launch

1. Rotate the Odoo API key (part 7).
2. Replace the placeholder YouTube videos in eLearning with real ones.
3. Check the Instagram and YouTube icons open the right profiles. Send the Facebook page address so it can be added.
4. Send the final Institution Gallery photos and the logo file with the "RoboNest" spelling.
5. Confirm the statistics shown on the site and the public email address.
6. Tag at least one upcoming event `Popup`, and a few videos and team members `Homepage`, so the home page is full on day one.
7. Give the developer access to the domain's DNS settings for the cutover, and tell staff the new Odoo login address.
